Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Neha is working as a developer for CityElectricity Board, which wants to build a household electricity billing system.

Each customer's electricity account has:

A Customer ID (integer) A Customer Name (string) Units Consumed (double)

The electricity bill is calculated based on these rules:

For the first 100 units 5 units charge per unit
For the next 100 units (101–200) 7 units charge per unit
For units above 200 10 units charge per unit
If the total bill exceeds 2000 units, a 5% discount is applied on the final bill.

Neha has been asked to implement this system using:

A class with attributes for customer details.A constructor to initialize customer details.Setter methods to update details if needed.Getter methods to retrieve details.Objects of the class to represent customers.

Finally, display each customer's details and final bill amount.

Input Format

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the Customer ID (integer).
- The following line contains the Customer Name (string).
- The next line contains the Units Consumed (double).

Output Format

For each customer, print the details in the following format:

Customer ID: <customer_id>

Customer Name: <customer_name>

Final Bill: <final_bill> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

1001

Ravi Kumar

80

Output: Customer ID: 1001

Customer Name: Ravi Kumar

Final Bill: 400.0

Answer

```
import java.util.*;
```

```
class Customer{  
    private int cus_id;  
    private String cus_name;  
    private double unit;  
  
    public Customer(int cus_id, String cus_name, double unit){  
        this.cus_id = cus_id;  
        this.cus_name = cus_name;  
        this.unit = unit;  
    }  
    public void set_cus_id(int cus_id){  
        this.cus_id = cus_id;  
    }  
    public void set_cus_name(String cus_name){  
        this.cus_name = cus_name;  
    }  
    public void set_unit(double unit){  
        this.unit = unit;  
    }  
  
    public int get_cus_id(){  
        return cus_id;  
    }  
    public String get_cus_name(){  
        return cus_name;  
    }  
    public double get_unit(){  
        return unit;  
    }  
  
    public double Calculate_bill(){  
        double bill = 0;  
        if(unit <= 100){  
            bill = unit * 5;  
        }  
        else if(unit <= 200){  
            bill = (100 * 5) + ((unit - 100) * 7);  
        }  
        else{  
            bill = (100 * 5) + (100 * 7) + ((unit - 200) * 10);  
        }  
    }  
}
```

```
if(bill > 2000){  
    bill = bill - (bill * 0.05);  
}  
return bill;  
}  
}  
class CityElectricity{  
    public static void main(String[] args){  
        Scanner sc = new Scanner(System.in);  
        int n = Integer.parseInt(sc.nextLine());  
  
        for(int i=0; i<n; i++){  
            int cus_id = Integer.parseInt(sc.nextLine());  
            String cus_name = sc.nextLine();  
            double unit = Double.parseDouble(sc.nextLine());  
  
            Customer customer = new Customer(cus_id,cus_name,unit);  
  
            System.out.println("Customer ID: " + customer.get_cus_id());  
            System.out.println("Customer Name: " + customer.get_cus_name());  
            System.out.printf("Final Bill: %.1f", customer.Calculate_bill());  
        }  
    }  
}
```
